

Universal Login Manager

Designed for small and medium sized businesses, the Universal Login Manager provides a simple way for users to identify themselves and have a personalized experience at the device. It also enables IT department to track printing and copying usage, all without requiring a server.

Multiple Login Modes

■ The imageRUNNER ADVANCE can be locked to ensure that only authorized people can access the device. Users can authenticate at the device by selecting their photo or by entering their username and password. The most convenient method, however, is by simply swiping their ID badge on the embedded card reader. The MiCard PLUS card reader supports over 35 different proximity technologies and can read any two card types simultaneously.

Serverless Design

■ The Universal Login Manager allows users to be authenticated directly on the device or via an Active Directory Server. When running in serverless mode, the administrator can create user accounts and set access permissions by using the web server on the device itself. This device based authentication information can then be shared across multiple devices. Alternatively, each device can be connected to a central Active Directory Server which hosts the authentication data.

Upgrade To uniFLOW

■ While the Universal Login Manager provides the simple security and tracking functionality required by small and medium businesses, many customers may need to go beyond this as their requirements change or their company grows. The Universal Login Manager can be simply upgraded to the full uniFLOW platform providing mobile printing and secure printing for any make or model of printer, advanced security, scanning workflows and a full automated statistics and reporting suite.
